## red-winged blackbird Agelaius phoeniceus

Kingdom: Animalia Phylum: Chordata Class: Aves Order: Passeriformes Family: Icteridae

#### ILLINOIS STATUS

common, native

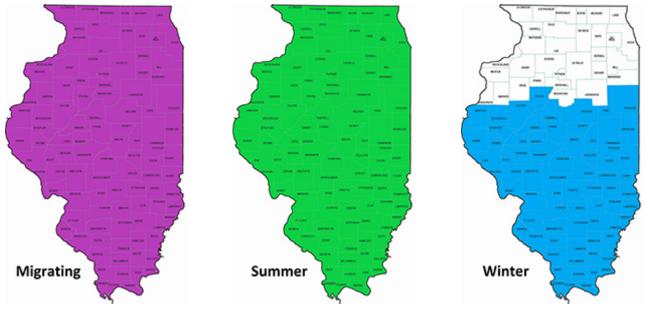

adult male

#### FEATURES

An adult red-winged blackbird is seven and one-half to nine and one-half inches in length. The male has black feathers except for red-feathered patches on each wing that are bordered in yellow. The female has brown body feathers with tan stripes. The bill is sharply pointed.

#### **BEHAVIORS**

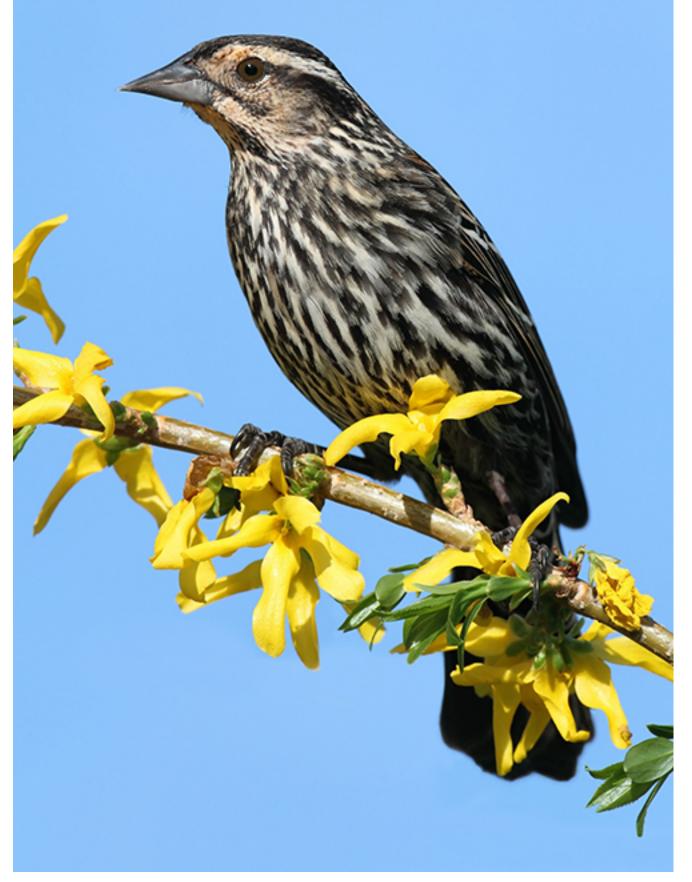

The red-winged blackbird is a common migrant and summer resident in Illinois. It is a common winter resident in southern and central Illinois. This species lives in marshes, swamps, ditches, cultivated land or hayfields. It feeds on insects and seeds. Its call is "konk-la-reeee" or "o-ka-leeee." These birds form huge roosts in winter. Males begin arriving in Illinois as early as January. Females arrive later, in March and April. Nesting occurs in clover fields, ditches, marshes, cultivated fields and wood edges during May through July. The cuplike nest is built close to the ground or on the ground. Three to five lightbrown to white to pale-blue eggs with black marks are laid. Cowbirds are known to parasitize redwinged blackbird nests, leaving an egg that will hatch into a young cowbird that the blackbirds will feed and care for. Fall migration begins in October.
