

# zebra

## *Heliconius charithonia*

### FEATURES

The zebra butterfly has a wingspan of about two and three-fourths to four inches. Its wings are black with yellow stripes, and the forewings are long and narrow. The hindwings have a row of yellow spots, too. The larva is white with bands of red and black and a yellow head.

### BEHAVIORS

The zebra butterfly is a rare stray into the southern one-half of Illinois. Its larva eats passion-flower plants that contain a distasteful poison. After the transformation in the pupa stage, the poison is retained in the body of the adult. The pupa stage wriggles when disturbed and makes a noise. The adult lives in densely wooded areas. Adults roost in groups, returning to the same roost each night.

### TAXONOMY

Kingdom: Animalia  
Phylum: Arthropoda  
Class: Insecta  
Order: Lepidoptera  
Family: Nymphalidae

### ILLINOIS STATUS

rare stray, native

### ILLINOIS RANGE

provided by William Perry/pond5.com

### **Aquatic Habitats**

bottomland forests

### **Woodland Habitats**

bottomland forests; coniferous forests; upland deciduous forests

### **Prairie and Edge Habitats**

none
