In reference to Part 240: Seismicity

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

## Fair Economy Illinois

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Abby Dompke Chicago, IL 60607

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Abraham Secular Chicago, IL 60615

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Anna Ronnen Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Bob Venier Dixon, IL 61021

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Brandi Madrid Chicago, IL 60640

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With its network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Carolyn Treadway Normal, IL 61761

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Christian Mortensen Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Daniel Ramus CHicago, IL 60625

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Elizabeth Scrafford chicago, IL 60626

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Emma LaBounty Chicago, IL 60615

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

## Fair Economy Illinois

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Florence Elgin, IL 60123

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Gadrel Williams Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, James Wauer Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Joe Kapran Chicago, IL 60615

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, John Hunt Chicago, IL 60641

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Kathy Machaj Chicago, IL 60607

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Kayli Horne Chicago, IL 60615

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Liza Pono Chicago, IL 60616

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Maddison Davis Chicago, IL 60605

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Michelle Mejia Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Navroz Tharani Chicago, IL 60615

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Nick Phillips Evanston, IL 60201

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Paul Papoutz Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With its network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate" or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Ramon Valladarez Chicago, IL 60642

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Roberta Weiner Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Ron Yehoshua Chicago, IL 60637

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Ryn Grantham Grantham Chicago, IL 60605

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Shaden Amara Naperville, IL 60564

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" init appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With its network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Ta Promlee Chicago, IL 60645

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Tim Law Chicago, IL 60637

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

## Fair Economy Illinois

---

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Vadim Tanyoin Chicago, IL 60637

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Westin Campo Chicago, IL 60608

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, William Toole Godfrey, IL 62035

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

## Fair Economy Illinois

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. ### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? Will fracking companies be held responsible for all monetary damages caused by earthquakes? If the frack site continues to operate in violation of a state order regarding it creating earthquakes the minimum fine is \$100. Who is making up these ridiculously industryslanted rules? In Act §1-96, the General Assembly orders assigns IDNR to consultation with the Illinois State

Geological Survey (ISGS) when devising a protocol to control the operations of Class II injection wells. The "cut points" in it appears that IDNR's did not consult with ISGS or seismologists on their devised "traffic light" control system indicate that IDNR did not consult with ISGS, seismologists or scientific study. It appears that the traffic light system was determined by bureaucratic fiat rather than through scientific reports and experts. We believe Rule 240.796 to be inconsistent and deficient, and the failure to consult with the ISGS results in a rule that (1) limits the scope of the law; (2) will result in uncompensated damages and possibly injury to private and public property holders, as well as possible injury to those residing in the vicinity of an injection well induced earthquake induced by a Class II injection well, and (3) will threaten aquifers with irreversible pollution or diminution of water quality. Points 2 and 3 "constitute a serious threat to the public interest, safety, or welfare" of Illinois citizens and businesses. Public infrastructure and buildings will also face costly and uncompensated damages. The National Academy of Sciences (2013) calls for the creation of a seismograph grid; these monitors to pinpoint the injections wells that has caused an earthquakes. It is self evident that without such a grid (1) the Act §1-96 (a) requirement to attribute a "felt earthquake" to a Class II injection well cannot be met; and (2) as a result, private and public parties will have no legal basis for compensatory relief. There is NO seismograph grid in Southern or Central Illinois and the IDNR has not called for one. Next, the IDNR creates a traffic light system that moves the yellow and red cut points to the right of prevailing expert opinion. For example, IDNR's red light for cessation of injections begins at M5.0 whereas experts place it at M4.0. In effect, IDNR has turned an expert red light into an agency yellow light so that well operators are given administrative permission to "run through red lights." Injection well earthquakes can cause serious damage. A recent example involves the Magnitude 5.7 earthquake in Prague, Oklahoma that destroyed 14 homes and damaged a highway (REFS). With is network of pre-existing, vertical faults and fractures --the outcome of past, "nature-made" earthquakes-- Southern Illinois is a prime candidate for induced seismicity once Class II injection wells pressurize and lubricate these pre-existing faults by injecting large quantities of gas or oilfield waste (flowback and produced water) deep underground. A second, possibly even more serious consequence, involves the possible flow of fluids between Class II injection wells and decommissioned oil wells, and from thence into aquifers and groundwater. 1.) Class II injections re-pressurize the permeable injection zone into which produced water is pumped, often a zone that once produced oil. 2.) This permeable injection zone can contain many well bores from decommissioned, nonproducing oil wells. Most of these wells are "plugged on paper" but they may no longer be plugged in fact. They have been "bathed" for decades in highly corrosive formation waters with chloride counts as high as 250,000 mg/l. This caustic broth can cause cement or casing failure of once adequately plugged wells. 3.) Once a "plugged on paper" well is broached, Class II "injectate " or fugitive brine has a fast path upward where it can then spread through aquifers. Conclusion: Many aquifers in Southern and Central Illinois face the prospect of serious, irreversible damage as a result of the inconsistent, deficient rulemaking in §240.796. In addition, the failure to consult experts at ISGS and elsewhere has the consequence of limiting the scope of the law. Solution: Observe these 5 empirically derived steps posed by Stanford University geophysicist Mark Zoback: (1) Avoid injection into active faults and faults in brittle rock. (2) Formations should be selected for injection (and injection rates should be limited) to minimize pore pressure changes. (3) Local seismic

monitoring arrays should be installed when there is a potential for injection to trigger seismicity. (4) Protocols should be established in advance to define how operations will be modified if seismicity is triggered. (5) Operators need to be prepared to reduce injection rates or abandon wells if triggered seismicity poses any hazard.

Sincerely, Zach Taylor Chicago, IL 60637

In reference to Part 240: Seismicity

### Section 240.796 Seismicity

The Rules contain language about earthquakes and, on a broader level, they also assume that fracking indeed causes earthquakes. The rules describe a whole series of fracking created earthquake levels of intensity. Why would the state allow any business activity that includes the real possibility of it creating earthquakes when done in an otherwise proper manner – especially in a geography known for major earthquakes? The rules are silent regarding broader concerns regarding how fracking created earthquakes will affect existing earthquake prone communities. There is no mention of scientific review or study of the effect of fracking earthquakes within the Wabash Valley and New Madrid Seismic Zones. The Illinois Emergency Management Agency identifies southern IL with its most severe earthquake zone ratings of “Destructive” and “Ruinous”. How does IDNR justify allowing any fracking in these areas when industry best practices say there should be no fracking in seismic zones? Rules define various intensities of fracking caused earthquakes by a color code system. Enforcement doesn’t begin until “yellow light alert”, (a magnitude of at least 3.0 but less than 5.0). This color coding system does not appear to be used by the federal USGS, the federal agency responsible for monitoring earthquakes. Why would IDNR use a system not used nationally? What is the purpose of IDNR’s color coded system and what value does it add to protect citizens who might be affected by said quakes? A fracking site can be responsible for creating up to 4 earthquakes up to a level of 4.9 magnitude WITHOUT a mandatory shut-down order by the state. A 4.9 earthquake is a serious and newsworthy event – (USGS description: “Sensation like a heavy truck striking building. Standing motor cars rocked noticeably.”) What justification does IDNR to allow this? Mandatory shut-down of a site is based on a patchwork of multiple earthquakes at multiple times with varying intensity. For example, if an earthquake caused by fracking “causes significant damage” or a magnitude of 5.0 or greater the state will shut-down the frack site. A 5.0 earthquake is described by USGS as “Felt by all, many frightened.” The rules use a dangerous, high threshold of earthquake intensity for a mandatory shut-down. The fracking caused earthquake literally has to frighten people or break something before the state will step in. What is the justification for such a high threshold? If a shut-down order is made, the fracking company gets a hearing, the purpose of which is to “mitigate induced seismicity events near the permitted well”. To “mitigate” is to minimize, not eliminate earthquakes caused by fracking. As with the overall message of the earthquake rules, the intent appears to not eliminate earthquakes caused by fracking but actually permit them. What does IDNR have to say to justify this? The penalty for failing to attend an earthquake hearing or continuing to frack after causing a serious, reported earthquake is \$50 for a first time violation. The rules define these violations as “Administrative penalties”. This amount is a little less than the cost of a dinner and a movie. Even with 4 or more earthquake violations, the maximum fine is only \$500, arguably an acceptable business expense. How is this justifiable? In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground. Researchers now say that the magnitude 5.7 earthquake near Prague, Okla., on Nov. 6, 2011, may also be the largest ever linked to wastewater injection. Felt as far away as Milwaukee, more than 800 miles away, the quake—the biggest ever recorded in Oklahoma--destroyed 14 homes, buckled a federal highway and left two people injured. <http://geology.gsapubs.org/content/early/2013/03/26/G34045.1> <http://www.usgs.gov/newsroom/article.asp?ID=3706&from=rss#.UohRF40hRL8> "Why America's Heartland is Earthquake Country", United States Geological Service, September 30, 2013 "Enhanced Remote Earthquake Triggering at Fluid-Injection Sites in the Midwestern United States", Nicholas J. van der Elst et al., DOI: 10.1126/science.1238948, Science 341, 164 (2013).

In reference to Part 240: Seismicity

Section 240.796 Seismicity In subsection (a)

"Applicability", DNR proposes that this rule apply ONLY to Class II injection wells, not to any other. DNR has not proposed any rules for fracking wells. This is insufficient protection of the population in southern Illinois where citizens are at risk of a major earthquake. Southern Illinois sits above two active seismic zones: the New Madrid and the Wabash Valley. There are two distinct earthquake risks: (1) the risks from injection wells inducing earthquakes that would not otherwise occur and (2) the risks of substantial injuries and damages created when the toxic fracking fluid left in the ground, in pipelines, and in wells (injection and otherwise) is let loose as a result of a major earthquake. There are NO rules establishing guidelines for stopping fracking wells in the event of earthquakes, and NO considerations for siting any wells specifically in active seismic zones. That omission is a reckless disregard for the safety of Southern Illinois residents, their property, and the ecology of the region. Furthermore, in light of recent studies (see below), the risk of earthquakes can extend far beyond local areas. See: <http://www.earth.columbia.edu/articles/view/3072> : A new study is the latest to tie a string of unusual earthquakes, in this case, in central Oklahoma, to the injection of wastewater deep underground.
