Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Madeline McCann Chicago, IL 60637

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Molly Blondell Chicago, IL 60637

S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Olivia Stovicek Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

In reference to Subpart A: General Provisions (245.100-245.120)

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Rachelle Ankney Chicago, IL 60626

In reference to Subpart A: General Provisions (245.100-245.120)

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Sandeep Malladi Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Sophia Johnson Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

Problems: The fatality rate of gas and oilfield workers is 7.6 times above all other industries and set an all-time high record in 2012 (King 2013). An inescapably dangerous work setting under the best of circumstances, frack pads are rendered even more dangerous by well operators who eschew workplace safety standards and who force employees to work excessively and dangerously long hours. Sixteen (16) to 20 hour work shifts can be scheduled with the end result that exhausted workers make mistakes in an unforgiving environment or fall asleep behind the wheel of a vehicle, often claiming their own lives and the lives of residents who happen to be on the wrong road at the wrong time (Urbina 2012). There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. S1-15e of the act gives IDNR the authority collect data, S1-75a2 give the criterion of significant risk and S1-120 gives other applicable laws regarding Hours of Service for Water and Sand Haulers. Yet, the rules do not specify any hours of service rules for sand and wwater delivery truckers; oilfield waiting time exception is for specialty trucks only. The rules also provide nothing on silica exposure tests or meeting OSH Permissible Exposure limites/NIOSH Rec. Exposure limits. Lastly, there are no rules for exposure to radioactivity at all.

Revisions needed: IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

Sincerely, Westin Campo Chicago, IL 60608

In reference to Subpart A: General Provisions (245.100-245.120)

Re: Draft Fracking Regulations Subpart A: General Provisions (245.100-245.120) Lack of a provision for tornado protection on fracking sites. Illinois has had 674 tornadoes in the last decade, and it is known as one of the states with the worst number and severity of tornadoes. Many workplaces have mandatory tornado evacuation drills and designated windowless tornado-safe rooms. Tornadoes not only cause destruction to the buildings they hit, but debris is carried up to several hundred miles away where it can cause secondary damage to buildings far from the original impacted area. Due to global warming we have seen the rate and severity of these severe weather events has been increasing. It is imperative that contaminated fracking flowback water be stored in a secure structure where it will be safely contained even during a severe tornado. The provision allowing temporary storage pools, out in the open with no protection, must be struck as this poses far too great a risk. There also needs to be a provision requiring that frack fluid be stored in a tornado-proof enclosure. Not doing so would risk tornadoes and associated flooding could potentially carry these chemicals unknown distances, putting our communities in danger.

Sincerely, Ivy Czekanski 601 W. Deming Place #502 Chicago, IL 60614

In reference to Subpart A: General Provisions (245.100-245.120)

Relevant parts of the Proposed Administrative Rules: Subpart A: General Provisions (245.100-245.120) . Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Andrew Panelli 12051 Mackinac Rd Homer Glen, IL 60491

In reference to Subpart A: General Provisions (245.100-245.120)

Scientific Proof that Links Hydraulic Fracturing to Groundwater Contamination: Terms: Methane (/ˈmɛθən/, /ˈmiːθən/ or /ˈmɛtæn/) is a chemical compound with the chemical formula CH<sub>4</sub> (one atom of carbon and four atoms of hydrogen). It is the simplest alkane and the main component of natural gas. The relative abundance of methane makes it an attractive fuel. However, because it is a gas at normal conditions, methane is difficult to transport from its source. Ethane is a chemical compound with chemical formula C<sub>2</sub>H<sub>6</sub>. At standard temperature and pressure, ethane is a colorless, odorless gas. Ethane is isolated on an industrial scale from natural gas, and as a byproduct of petroleum refining. Its chief use is as petrochemical feedstock for ethylene production. Propane is a three-carbon alkane with the molecular formula C<sub>3</sub>H<sub>8</sub>, normally a gas, but compressible to a transportable liquid. A by-product of natural gas processing and petroleum refining, it is commonly used as a fuel for engines, oxy-gas torches, barbecues, portable stoves, and residential central heating. Propane is one of a group of liquefied petroleum gases. The others include butane, propylene, butadiene, butylene, isobutylene and mixtures thereof. Isotopic composition is the number and abundance of the isotopes of the element which are naturally occurring. Isotopes are atoms of the same element (that means they have the same number of protons) but different numbers of neutrons in the nucleus. Isotopes all have identical chemistry but the atoms just have different masses. The simplest example is Chlorine which has two main isotopes Cl-35 has 17 p and 18 neutron (17 + 18 = 35) Cl-37 has 17 p and 20 n (17 + 20 = 37) Every sample of Chlorine always has 3 Cl-35 atoms to every 1 Cl-37 atom. Summary: In a study completed by Robert B. Jackson Et al evidence was found that linked hydraulic fracturing to groundwater contamination by recording the variations of the presence of methane, ethane, and propane in well water of houses, in ratio to the distance of the houses to the gas wells. According to the study, after analyzing 141 drinking water wells across the Appalachian Plateaus physiographic province of northeastern Pennsylvania, examining natural gas concentrations and isotopic signatures with proximity to shale gas wells the presence of methane, ethane, and propane was significantly higher in the well water of homes that were located within one kilometer of a shale gas well compared to those that were farther away. Methane concentrations in drinking water wells of homes <1 km from natural gas wells (59 of 141) were six times higher on average than concentrations for homes farther away. The isotopic compositions also revealed evidence that hydraulic fracturing could be linked to groundwater contamination. Samples were taken from a natural methane seep at Salt Springs State Park in Franklin Forks, Pennsylvania to compare with drinking water from homes in the study, some located within a few kilometers of the spring. There was methane present in all of the water that was sampled. However the isotopic compositions varied. Some of the samples showed the more common trend consistent with Upper Devonian production gases, Upper Devonian gases are likely introduced into the shallow crust either by natural processes over geologic time or through leakage around the casing in the annular space of the production well. However, the samples also revealed that drinking water samples in their dataset with sufficient ethane to analyze isotopic signatures, 11 samples were located <1.1 km from drilling, and 6 samples exhibited clear isotopic reversals similar to Marcellus production gases. In most

natural gases, the isotopic composition ( $\delta^{13}\text{C}$ ) of  $\text{C}_3 > \text{C}_2 > \text{C}_1$  (i.e.,  $\delta^{13}\text{C}$  of ethane is heavier than methane). In thermally mature black shales, however, this maturity trend reverses, creating diagnostic isotopic reversals in which the  $\delta^{13}\text{C}-\text{CH}_4$  becomes heavier than  $\delta^{13}\text{C}-\text{C}_2\text{H}_6$  ( $\delta^{13}\text{C} = \delta^{13}\text{C}-\text{CH}_4 - \delta^{13}\text{C}-\text{C}_2\text{H}_6 > 1$ ). Natural gas with heavy  $\delta^{13}\text{C}-\text{CH}_4$  and  $\delta^{13}\text{C} > 0$  likely stems from Marcellus production gases or a mixture of Marcellus gases and other annulus gases that migrated to the surface during drilling, well completion, or production. Visual References and Citation: According to the study, after analyzing 141 drinking water wells across the Appalachian Plateaus physiographic province of northeastern Pennsylvania, examining natural gas concentrations and isotopic signatures with proximity to shale gas wells, “Methane was detected in 82% of drinking water samples, with average concentrations six times higher for homes <1 km from natural gas wells ( $P = 0.0006$ ). Ethane was 23 times higher in homes <1 km from gas wells ( $P = 0.0013$ ); propane was detected in 10 water wells, all within approximately 1 km distance ( $P = 0.01$ ).” Their data also stated that “some homeowners living <1 km from gas wells have drinking water contaminated with stray gases.” Also, “Of three factors previously proposed to influence gas concentrations in shallow groundwater (distances to gas wells, valley bottoms, and the Appalachian Structural Front, a proxy for tectonic deformation), distance to gas wells was highly significant for methane concentrations ( $P = 0.007$ ; multiple regression), whereas distances to valley bottoms and the Appalachian Structural Front were not significant ( $P = 0.27$  and  $P = 0.11$ , respectively). Distance to gas wells was also the most significant factor for Pearson and Spearman correlation analyses ( $P < 0.01$ ). For ethane concentrations, distance to gas wells was the only statistically significant factor ( $P < 0.005$ ). Isotopic signatures ( $\delta^{13}\text{C}-\text{CH}_4$ ,  $\delta^{13}\text{C}-\text{C}_2\text{H}_6$ , and  $\delta^2\text{H}-\text{CH}_4$ ), hydrocarbon ratios (methane to ethane and propane), and the ratio of the noble gas  $^4\text{He}$  to  $\text{CH}_4$  in groundwater were characteristic of a thermally postmature Marcellus-like source in some cases.” Their study area is within the Appalachian Plateaus physiographic province and includes six counties in Pennsylvania. They sampled 81 new drinking water wells (at an average depth of drinking of 60–90 m) from the three principle aquifers combined the data with results from 60 previously sampled wells in Pennsylvania. They also sampled a natural methane seep at Salt Springs State Park in Franklin Forks, Pennsylvania to compare with drinking water from homes in our study, some located within a few kilometers of the spring. Dissolved methane was detected in the drinking water of 115 of the 141 houses that were sampled. “Methane concentrations in drinking water wells of homes <1 km from natural gas wells (59 of 141) were six times higher on average than concentrations for homes farther away ( $P = 0.0006$ , Kruskal–Wallis test). Of 12 houses where  $\text{CH}_4$  concentrations were greater than 28 mg/L (the threshold for immediate remediation set by the US Department of the Interior), 11 houses were within 1-km distance of an active shale gas well. The only exception was a home with a value of 32 mg  $\text{CH}_4/\text{L}$  at 1.4-km distance.” “Similar to the results for methane, concentrations of ethane ( $\text{C}_2\text{H}_6$ ) and propane ( $\text{C}_3\text{H}_8$ ) were also higher in drinking water of homes near natural gas wells. Ethane was detected in 40 of 133 homes (30%; 8 fewer homes were sampled for ethane and propane than for methane). Propane was detected in water wells in 10 of 133 homes, all approximately <1 km from a shale gas well ( $P = 0.01$ ). Ethane concentrations were 23 times higher on average for homes <1 km from a gas well: 0.18 compared with 0.008 mg  $\text{C}_2\text{H}_6/\text{L}$  ( $P = 0.001$ , Kruskal–Wallis). Seven of eight  $\text{C}_2\text{H}_6$  concentrations  $>0.5$  mg/L were found <1 km from a gas well, with the eighth point only 1.1 km away. Moreover, the higher ethane concentrations all occurred in

groundwater with methane concentrations  $>15$  mg/L ( $P = 0.003$  for the regression of C2 and C1) “High C3/C1 samples were also an order of magnitude greater than in salt-rich waters from a natural methane seep at the nearby Salt Springs State Park (mean  $[C3]/[C1] = 0.000029$  and  $[C3] = 0.0022$  mg/L for the salt spring samples). Because microbes effectively do not produce ethane or propane in the subsurface our observed values within approx. 1 km of drilling seem to rule out a biogenic methane source, and they are consistent with both wetter (higher C2 + C3 content) gases found in the Marcellus Formation and our earlier observation of methane in drinking water wells in the region” “Across our dataset, the most thermogenic  $d_{13}C$ -CH<sub>4</sub> signatures (i.e., most enriched in  $^{13}C$ ) in drinking water were generally found in houses with elevated  $[CH_4]$   $<1$  km from natural gas wells... In fact, all drinking water wells with methane concentrations  $>10$  mg/L, the US Department of Interior’s threshold for considering remediation, have  $d_{13}C$ -CH<sub>4</sub> signatures consistent with thermogenic natural gas. Our data also show a population of homes near natural gas wells with water that has  $d_{13}C$ -CH<sub>4</sub> signatures that seem to be microbial in origin, specifically those homes shown in Fig. 3A, lower left corner. The combination of our  $d_{13}C$ -CH<sub>4</sub>... and  $d_2H$ -CH<sub>4</sub> data...overall, however, suggests that a subset of homes near natural gas wells has methane with a higher thermal maturity than homes farther away.” “Analyses of  $d_{13}C$ -CH<sub>4</sub> and  $d_{13}C$ -C<sub>2</sub>H<sub>6</sub> can help constrain potential sources of thermally mature natural gases (14, 15, 30). Because organic matter cracks to form oil and then natural gas, the gases initially are enriched in higher aliphatic hydrocarbons C2 and C3 (e.g.,  $C_3 > C_2 > C_1$ ; i.e., a relatively wet gas). With increasing thermal maturity, the heavier hydrocarbons are progressively broken down, increasing the C1:C<sub>2</sub>+ ratio and leading to isotopic compositions that become increasingly heavier or enriched (31). In most natural gases, the isotopic composition ( $d_{13}C$ ) of  $C_3 > C_2 > C_1$  (i.e.,  $d_{13}C$  of ethane is heavier than methane). In thermally mature black shales, however, this maturity trend reverses, creating diagnostic isotopic reversals in which the  $d_{13}C$ -CH<sub>4</sub> becomes heavier than  $d_{13}C$ -C<sub>2</sub>H<sub>6</sub> ( $\delta_{13}C = d_{13}C\text{-CH}_4 - d_{13}C\text{-C}_2\text{H}_6 > 1$ ) (14, 15, 28, 30, 32). For 11 drinking water samples in our dataset with sufficient ethane to analyze isotopic signatures, 11 samples were located  $<1.1$  km from drilling, and 6 samples exhibited clear isotopic reversals similar to Marcellus production gases (Fig. 4). Conversely, five drinking water samples and spring water from Salt Springs State Park showed the more common trend consistent with Upper Devonian production gases (Fig. 4). In the study area, these isotopic values suggest multiple sources for hydrocarbon gases. The Upper Devonian gases are likely introduced into the shallow crust either by natural processes over geologic time or through leakage around the casing in the annular space of the production well. In contrast, natural gas with heavy  $d_{13}C$ -CH<sub>4</sub> and  $\delta_{13}C > 0$  likely stems from Marcellus production gases or a mixture of Marcellus gases and other annulus gases that migrated to the surface during drilling, well completion, or production.” Measurements taken by the EPA (Residential Data Reports found at [http://www.epaos.org/site/doc\\_list.aspx?site\\_id=7555](http://www.epaos.org/site/doc_list.aspx?site_id=7555)) “independent CH<sub>4</sub> measurements taken by the US Environmental Protection Agency (EPA) in Dimock, Pennsylvania in January of 2012 also show three  $d_{13}C$ -CH<sub>4</sub> values in drinking water wells between  $-24.98\%$  and  $-29.36\%$   $d_{13}C$ -CH<sub>4</sub> and five samples with  $d_{13}C$ -CH<sub>4</sub> values in the range of Marcellus gas defined in ref. 28. The heaviest methane isotopic signatures in the EPA samples ( $-24.98\%$   $d_{13}C$ -CH<sub>4</sub>) exceeded the values observed for ethane ( $-31.2\%$   $d_{13}C$ -C<sub>2</sub>H<sub>6</sub>), an isotopic reversal ( $\delta_{13}C = 6.22\%$ ) characteristic of Marcellus or other deeper gas compared with gases from Upper Devonian sequences” Jackson, Robert

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Abby Dompke Chicago, IL 60607

The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Andrew Sigman Chicago, IL 60651

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Colleen Dennis Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Emilio Joseph Comay del Junco Chicago, IL 60615

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Jesse Silliman Chicago, IL 60615

The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Joseph Gary New York, IL 10003

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Keri Curtis Peru, IL 61354

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Mary Trimmer Granite City, IL 62040

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Norma Claire Moruzzi Chicago, IL 60640

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. HAS ANYONE LOOKED AT THE RELATIONSHIP BETWEEN HYDRO-FRACKING IN SEISMIC ZONES AND THE LOCATION OF COAL ASH AND COAL SLURRY IMPOUNDMENTS? I THINK THESE WOULD BE PARTICULARLY VULNERABLE, GIVEN THE FACT THAT THEY ARE CONSTRUCTED AS 'TEMPORARY' STRUCTURES. Solution: Prohibit fracking in active seismic zones.

Sincerely, Pamela J. Richart 1645 W. Jarvis Chicago, IL 60626

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Avoid fracking in active seismic zones and flood plains. Fracking is short-sighted. I have heard proponents say that it will provide much needed jobs to our state. Everyone knows that this is a half truth, it will provide jobs in the short term but not over the long haul and it will jeopardize our precious earth and water.

Sincerely, Patricia L. Dalke Chicago, IL 60645

The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Raj Kapoor Oak Park, IL 60302

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Sasha Mitrofanenko Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Sloane Moore River Forest, IL 60305

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Prohibit fracking in active seismic zones and flood plains.

Sincerely, Veronica Murashige Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. In reference to Subpart A: General Provisions (245.100-245.120)

Since public hearings are an important part of the democratic process, it makes sense that there is a proper method of making sure that citizens are informed of the hearing and are given proper time to prepare for such a hearing as well as time to plan the travel and hearing into their schedule, as many people are parents, workers, students, among many other obligations. This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Bing Li Chicago, IL 60608

Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Bing Li Chicago, IL 60608

In reference to Subpart A: General Provisions (245.100-245.120)

Since public hearings are an important part of the democratic process, it makes sense that there is a proper method of making sure that citizens are informed of the hearing and are given proper time to prepare for such a hearing as well as time to plan the travel and hearing into their schedule, as many people are parents, workers, students, among many other obligations. This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. In reference to Subpart A: General Provisions (245.100-245.120)

The current regs do not require companies engaged in fracking to take any steps to prevent damage to the fracking site from tornadoes. Certain parts of Illinois are quite prone to tornadoes, similar to the well known tornado alley further west. The regs should require fracking companies to take steps to protect the site from fracking damage, consistent with the tornado history of the area where fracking is occurring. Special vulnerabilities which should be addressed are above ground storage tanks with liquid used in/produced by the fracking process.

Sincerely, Eileen Sutter 4125 North Monticello Chicago, IL 60618

In reference to Subpart A: General Provisions (245.100-245.120)

The Department of Homeland Security has been pushing US citizens for years to have an emergency plan related to a catastrophic event, especially regarding terrorism. However, terror-related events are far less common than tornadoes in central and southern Illinois. So it would follow that an industry that produces toxic waste would have an emergency plan for dealing with tornados. Number of draft regulations proposed by Illinois Dept. of Natural Resources describing safety measures regarding tornado strikes on fracking sites: ZERO. Number of tornadoes in Illinois in the last 10 years: 674. Historically, the number and intensity of tornadoes in Illinois is very high. "In fact, Illinois has experienced some of the worst tornadoes in US history." Dr. Jim Angel, Illinois State Climatologist. Every county in Illinois has had multiple tornadoes as demonstrated by the maps in the following links:  
<http://www.isws.illinois.edu/atmos/statecli/tornado/ilmaps.htm>  
[http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC\\_Tornado...](http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC_Tornado...) A big swath of Washington, IL was flattened by a tornado on Sunday, 11/17/13. What would have happened if this tornado had hit an area of the state covered in fracking sites? Debris from the tornado has been found over 150 miles away. Imagine if that debris had included "temporarily" stored flowback water or tanks filled with frack fluid or produced water!

Sincerely, Scott Condren Chicago , IL 60608

In reference to Subpart A: General Provisions (245.100-245.120)

The 'fracking' regulations being put forth are a DISGUSTING betrayal of the citizens of Illinois. The petty 'slap on wrist' fines and public reporting are abysmal ! The regulations FAIL to protect citizens from damages cause by operations and the TOXIC brew of chemicals. Your proposal result in substantial HARM to citizens and environments all so a tiny few receive enormous profits.

Sincerely, Jim Oppedahl My City, IL 61201

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources fracking rules are weak - offering little protection for the citizens of Illinois. The fines are so minimal as to be a slap in the face to those who want to protect their homes and property from abuse. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate.

Sincerely, Rita McCabe LaGrange, IL 60526

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. At least take a more serious look at the terrible record we've seen elsewhere. Big Money is corrupting our society, and it may be affecting the decisions DNR makes. Don't let that happen.

Sincerely, Harlan Johnson Rockford, IL 61102

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. Clean water is critical for all life and frackers have been notorious for using chemicals that pollute and poison water. Also, after fracking, once beautiful land looks hideous, without any plant life. Illinois needs money but we should not become a state where the countryside looks like the site of a chemical war and people should not be afraid to drink our water. Once the water is contaminated, there's no turning back. We can't trust the frackers to be ethical, only to be profitable.

Sincerely, Barbara Pohl Chicago, IL 60618

## Fair Economy Illinois

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. I have relatives who live in W. Va where fracking has destroyed the farms and homes of MANY people including many who are victims of their neighbors' allowing fracking and the destruction of lands and wells with no compensation. The lands and homes are now worth very little so they can not be sold. The people are SOL while the energy companies are doing VERY WELL!. I do realize that fracking has provided much cheaper fuel for many people particularly in the east as well as cheaper feed stock for the plastics industry as well as jobs for Americans, but at what cost to our lands and the environment. IF it could be done safely, all well and good but at this time it is NOT SAFE, CAUSING EARTHQUAKES AND RUINING LANDS AND HOMES! PLEASE tighten up all of the rules and regulations before we look like W. VA!

Sincerely, Hilda Fischer Oak Park, IL 60304

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. Illinois has other options that will create MORE jobs, MORE wealth and MORE energy WITHOUT polluting BOTH the air and the water and only producing more green-house gases.

Sincerely, James Van Camp Glen Ellyn, IL 60137

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. Such short-sighted and desperate action is a clear indication that the industrial addiction to oil and other hydrocarbon fuels needs to end. If we are willing to sacrifice other necessary natural resources, including water, one of the most basic components of life on this planet, in order to feed the addiction then there is no hope for a sustainable tomorrow. The Illinois Department of Natural Resources can ensure that the citizens of Illinois, current and future, are able to thrive in an environment in which such basic resources are plentiful and unpolluted by creating more severe regulatory legislation. By failing to do so, you fail the people of Illinois as well as set a dangerous precedent for the future.

Sincerely, Pat Leary Riverside, IL 60546

In reference to Subpart A: General Provisions (245.100-245.120)

The Illinois Department of Natural Resources is supposed to regulate the industry, not allow them to continue business as usual. Please reconsider the regulations put forth and stop fracking in Illinois now to protect our air, water, and climate. There are stiffer penalties for drivers than there are for frackers, and that is just wrong. Let's make sure we safeguard the health of those unlucky enough in live in fracking areas from poisoned ground water and potential earth quakes. There is too much information out there from states that already have fracking for Illinois to turn a blind eye, as been the case so far. Start taking the health and safety of Illinois residents seriously!

Sincerely, Bruce Anderson Rolling Meadows, IL 60008

In reference to Subpart A: General Provisions (245.100-245.120)

The INDR has violated its own administrative rules by not providing the required public notice for any of the public hearings. In each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. DNR has chosen by rule to require a minimum of 20 days' notice. I can only assume the reason for the rush, especially during the holiday season, is to give the fracking industry the advantage by not allowing the public ample time to prepare for the hearings. Just who, or what, is controlling the process? Fracking is inherently dangerous and destructive and this rush to frack our state into a contaminated uninhabitable mess is insane. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or preferably, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Lois Kain 1602 S Carle Ave Urbana, IL 61801

In reference to Subpart A: General Provisions (245.100-245.120)

The risk of large scale environmental disasters How does this affect me: Health and well-being Radioactivity Seismicity (Earthquake activity) Water Integrity . Relevant parts of the Proposed Administrative Rules: Subpart A: General Provisions (245.100-245.120) . Section 1-53 of the regulatory bill requires that fracking operations be conducted in a “manner that will protect the public health and safety and prevent pollution.” And yet, the rules do not address the risk of large-scale and widespread environmental disasters that can occur as a result of fracking in the Wabash Valley and New Madrid Earthquake Zones or in the Illinois 100-year floodplain. The New Madrid Earthquake zone has been known to historically cause “major” earthquakes of over 7 on the Richter magnitude scale. The Illinois Emergency Management Agency itself identifies these areas with its most severe earthquake zone ratings of “Destructive” and “Ruinous.” An earthquake of these magnitudes, compounded with fracking and injection wells spread throughout the affected zone is quite literally, a recipe for disaster. Furthermore earthquakes of these magnitudes can easily damage fracking wells, open air pits, pipelines, injection wells - causing toxic and radioactive fracking fluids to pour out into the ground and contaminate the soil and groundwater sources of hundreds of thousands of Illinoisans. Even Ohio Governor, John Kasich, a fracking advocate, has issued an executive order requiring operators to conduct seismic studies before the state will issue well permits. Similarly, allowing any sort of fracking operations to occur within the Illinois 100 year floodplain zone is also asking for disaster. The environmental devastation caused by the recent floods in Colorado is a case in point. Inundated oil pads, flooded wells, overturned tanks, and ruptured lines were just a few of problems experienced in Colorado as a result of wide-scale flooding. A damaged oil tank dumped 5,250 gallons of oil into the South Platte River south of Milliken, Colorado on 9/18/13 during the flood. The South Platte River, extends to Nebraska and then filters into the Ogallala Aquifer which serves much of the middle of the country. Open-air pits—which the Rules allow—are particularly vulnerable in a flood. When open-air pits fill with water, there is nothing covering the surface to prevent the fracking wastewater from spilling out of the pit and into the floodwaters, exposing every living thing downstream to the chemicals, brine, radioactivity, etc. that was in the pit. Solution: Avoid fracking in active seismic zones and flood plains.

Sincerely, Patti Walker RR#2 (Box42a) Karbers Ridge, IL 62955

In reference to Subpart A: General Provisions (245.100-245.120)

The tornadoes that struck Washington, IL would have been even more devastating had Illinois already been engaged in the industrialization of fracking. As demonstrated by paper envelopes found hundreds of miles from the environs of the tornado area, chemicals and produced waste with radioactive elements would have been spread far beyond the local communities, which would have been ruined. Can you imagine the cost of clean up? Clean up. Would that be possible? Because of the weather pattern change, and the fact that half the tornado warnings in twenty Novembers occurred in this past November, the Rules are insufficient. The Rules must be rewritten.

Sincerely, Jill Paulus 1806 Marion Ct Wheaton , IL 60187

## Fair Economy Illinois

---

In reference to Subpart A: General Provisions (245.100-245.120)

There are at least two work related dangers at frack pads that should fall under OSHA regulations: exposure to (1) radiation and (2) silica dust. Both can increase rates of cancer among exposed workers and both kinds of work-site related exposure are limited and regulated by OSHA. Yet, the oil and gas industry have found an easy way to escape regulation: simply don't test for work place exposure. Since there are no data on exposure, OSHA cannot step in and demand workplace fixes. 1.IDNR must require fracking operators to adhere to OSHA rule and regulations, especially regarding dust and radioactivity. 2.IDNR must develop rules which recognize and regulate non-union frack operations to address inherently dangerous workplace conditions, including but not limited to work shifts, working conditions, and truck transportation to and from operations.

In reference to Subpart A: General Provisions (245.100-245.120)

There is NO provision to address the danger from tornadoes. None of the draft regulations proposed by IDNR provide safety measures for tornado strikes on fracking sites, despite that there have been 674 tornadoes in Illinois in the last 10 years. Historically, the number and intensity of tornadoes in Illinois is very high. "In fact, Illinois has experienced some of the worst tornadoes in US history," reports Dr. Jim Angel, Illinois State Climatologist. Every county in Illinois has had multiple tornadoes as demonstrated by the maps in the following links:

<http://www.isws.illinois.edu/atmos/statecli/tornado/ilmaps.htm>  
[http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC\\_Tornado...](http://www.isws.illinois.edu/atmos/statecli/tornado/NewMaps/MRCC_Tornado...) A big swath of Washington, IL was flattened by a tornado on Sunday, 11/17/13. What would have happened if this tornado had hit an area of the state covered in fracking sites? Debris from the tornado has been found over 150 miles away. Imagine if that debris had included "temporarily" stored flowback water or tanks filled with frack fluid or produced water!

Sincerely, Dolores C. Pino, B.A., J.D. 7200 Wilson Terrace Morton Grove, IL 60053-1142

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Abby Dompke Chicago, IL 60607

However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Abby Dompke Chicago, IL 60607

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Anne Pertner Pertner Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Chris Turner Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Dylan Amlin Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Garrick Balk 236 Prairie Street South Elgin, IL 60177-1528

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, joann conrad 13 red oak lane springfield, IL 62712

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Kevin Casto Chicago, IL 60615

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Louis Clark Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Molly Connor Chicago, IL 60605

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Rachele Ankney Chicago, IL 60626

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Ryan Kidman Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Stanley Archacki Westmont, IL 60559

In reference to Subpart A: General Provisions (245.100-245.120)

This comment concerns the public hearings held by DNR on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: Section 5-40 of the Illinois Administrative Procedure Act provides as follows: At least one agency representative shall be present during the hearing who is qualified to respond to general questions from the public regarding the agency's proposal and the rulemaking process. 5 ILCS 100/5-40. At the public hearings in Chicago, (11/26/13), Ina (12/3/13), Effingham (12/16/13), Decatur (12/17/13) and Carbondale (12/19/13), DNR representatives were present on the panel, along with the hearing officer. However, at each of the hearings, the hearing officer made various statements that informed the citizens in attendance that the panel members would NOT answer questions. For example, the hearing officer stated that the DNR representatives were there to listen, that they would not respond to any comments, and that the hearing was not a question-and-answer session. Thus, because the agency officials were not available to answer general questions regarding the proposal and the rulemaking process, these public hearings were held in violation of the Illinois Administrative Procedure Act. The remedy for these violations is either additional hearings in Chicago, Ina, Effingham, Decatur and Carbondale or, alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, William Thomas Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Abby Dompke Chicago, IL 60607

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Abraham Secular Chicago, IL 60615

DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Alonzo Cummins Chicago, IL 60612

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Ava Benezra Chicago, IL 60615

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Bing Li Chicago, IL 60608

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Bing Li Chicago, IL 60608

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Carla Hunter Chicago, IL 60605

DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Cindy Chung Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, David Klawitter Chicago, IL 60607

Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Dylan Amlin Chicago, IL 60605

Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Edith Villavicencio New York, IL 10003

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Elias Friedman Chicago, IL 60605

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Emily Huang Chicago, IL 60637

DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Francis Beach Chicago, IL 60637

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

In reference to Subpart A: General Provisions (245.100-245.120)

This comment is in response to the paragraphs of the published notices setting the dates for the public hearings on the Proposed Amendments to the Rules under the Oil and Gas Act and on the Proposed Rules under the Hydraulic Fracturing Regulatory Act. 37 Illinois Register 18081, 18081-82 (November 15, 2013); 37 Illinois Register 18097, 18099 (November 15, 2013); 37 Illinois Register 19746 (December 6, 2013); 37 Illinois Register 19747 (December 6, 2013). Comment: DNR did not provide the required public notice for any of the public hearings, because in each case the notice for the hearing was not published in the Illinois Register at least 20 days before the hearing. Although the Illinois Administrative Procedure Act allows DNR to hold a public hearing, in response to a request for a hearing, less than 20 days after public notice in the Illinois Register if the notice of hearing is published in the notice of proposed rulemaking (5 ILCS 100/5-40), DNR has chosen by rule to require a minimum of 20 days' notice. DNR's adopted rule for scheduling public hearings states as follows: The Hearing Officer shall set a time and place for hearing and shall give notice as follows, at least 20 days prior to the date of the hearing; a) to the proponent, by mail; b) to members of the general public, by means of a general news release and notice in the Illinois Register. 2 Ill. Admin. Code 825.140. The first notice of public hearings--for Chicago and Ina--was published in the Illinois Register on November 15, 2013. But the Chicago hearing took place on November 26, 2013, and the Ina hearing took place on December 3, 2013. Each of those hearings was held on less than 20 days' notice. The second notice of public hearings--for Effingham, Decatur, and Carbondale--was published in the Illinois Register on December 6, 2013. But the Effingham hearing took place on December 16, 2013, the Decatur hearing took place on December 17, 2013, and the Carbondale hearing took place on December 19, 2013. Each of those hearings was held on less than 20 days' notice. Thus, DNR's public hearings were held in violation of its own administrative rules. These violations deprived the citizens of a meaningful opportunity to be heard. The remedy for this violation is either additional hearings in these areas, each with the required minimum 20 days' notice, or alternatively, a new First Notice with the opportunity for new public hearings and a new public comment period.

Sincerely, Grace Pai Chicago, IL 60615
