grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Pam Hill

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

020812

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and

626325

fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jason Mortensen

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

I believe you are derelict in your duties to protect the people and the natural resources of we people of Illinois. I have read the detail report compiled by the people affected in Pennsylvania of how fracking has destroyed their water, their land, their health, their finances, their lives, and the future of all the people who are stuck inheriting that space.

I believe that these new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines. This was never the intention of anyone including our elected representatives and knowledgeable environmentalists.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow. It cannot be allowed to happen.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Julie Moyer

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking":

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under

626865

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Walter Schmitt

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile

And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Isabel Bichao

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of

026892

hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Dana Sullivan

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois

Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Karen Long MacLeod

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from

626935

when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater,

626914

hydraulic fracturing, better known as "fracking";

I am truly horrified that the practice of fracking is being allowed at all, in this country or anywhere. The threats it poses to our natural resources are so real and so extreme that I am shocked that we would be willing to engage in it. For the sake of a short term and filthy energy supply we are willing to sacrifice potable drinking water for the foreseeable future. Can this possibly seem like a reasonable bargain to anyone? Not to mention that the methane produced by the practice of fracking is even more damaging to our environment than CO<sub>2</sub>, and this at a time of rapid climate change.

What I find so disturbing and sad is that any arguments I could make in this letter concerning the new rules for fracking in Illinois and how they are so drastically inadequate have already been made by countless other people before me, and in fact you already knew these things when you drafted these rules. You are willing to sacrifice our planet, our drinking water, the air we breathe - so what more can I say other than please don't do this to us. Please. I wish I could say this to you in person, because I think it is easier to ignore nameless faceless people. It is easier to ignore a future that you can't see yet, and generations of people who are not yet born. Please don't destroy things for them, for us.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Rachel Krucoff

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits,

020918

new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Armin Balli

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

020928

I urge you to make the following changes in the draft rules to fully implement the controls in the Act.

- 1) Fracking risks significant pollution of ground waters. Consequently, you must strengthen the protections against water pollution by:
  - a. Eliminating the potential abuses of "emergency pits" in the proposed regulation.
  - b. Extending the protections in the rules to include the FULL RANGE of chemicals used in Fracking, without regard to any claims of proprietary interests or trade secrets.
  - c. Requiring that complete descriptions of the processes and chemicals employed at a site are easily accessible and readily available to first responders and emergency medical personnel so that they can appropriately manage unexpected incidents.
  - d. Writing protections for fragile wells, streams or ponds into the rules to protect populations from exhaustion and contaminations of these vital resources.
- 2) Many loopholes in the existing regulations must be closed. For example:
  - a. All high-volume Fracking Operations should be covered.
  - b. The limits on the use of foams and gases in base fluids must be well defined and closely regulated.
  - c. The rules must fully apply to regulate all ongoing operations.
  - d. Existing operations must not be exempted from the full force of the rules for any reason, and if permits are modified all individuals impacted must be advised of the changes to be made.
- 3) Penalties must be significantly increased to discourage violation of the law. Failure to comply with the law should be made expensive enough to rectify problems and address legal liabilities that might arise.
- 4) Since hydrocarbons are potent greenhouse gases, it is critical that the rules assure the quantitative recovery of the gas liberated during Fracking without regard to the expense incurred. Failure to comply should be severely punished and proven violations should prevent issuing future Fracking permits to violators.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Food & Water Watch

Subject: Rules DNR is Working on Right Now

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

After I completed a college degree in education, I taught science at the high school level for three years. I then resumed my education and received a PhD in Chemistry from the University of Wisconsin, Madison. I taught at the college level for seven years, attaining tenure as Associate Professor. I left academia and began work in industrial research, where I became a Senior Research Specialist in the fields of petroleum and petrochemicals. After 27 years in the research centers of the same major corporation, I retired with 27 US Patents and dozens of scientific publications. Consequently, I feel competent to comment on the potential scientific concerns associated with the Hydraulic Fracturing Process (Fracking).

There are many problematic aspects in Fracking technology and I comment upon some below. But first I want to point out that the current emphasis on acquiring and burning the last traces of hydrocarbon in the crust of the Earth is a flawed policy. Actually, if we utilize more than a fraction of currently proven hydrocarbon reserves, the temperature of the atmosphere will increase so much that the entire ecology is threatened. That would risk the lives of people like you, me and my grandchildren. So, I want to end or significantly restrict extractive processes. Since the state government has agreed to permit Fracking in Illinois, I am here to ask you to control the dangers associated with Fracking.

020930

begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Joseph Knell

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only

020944

the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
traci brown

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

I wonder how many of the earthquakes in the mid-west are due to fracking? Additionally, I worry about the quality of our drinking water if things go awry in fracking areas, as they will because all mining endeavors have accidents. What is the cost of this in real-people terms? WHAT DO WE REALLY WANT FOR OUR CITIZENS????

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed

020951

inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. The whole process wastes an incredible amount of otherwise potable water, at a time when water is becoming an ever more scarce resource. Fracking also requires that hundreds of truckloads of equipment, supplies, and waste be transported to and from each drilling site, causing a huge increase in carbon emissions. It also causes horrible air pollution, habitat destruction, and land and water pollution, and most importantly, diverts our efforts away from developing renewable, clean energy production. The only way to avoid these problems is with an outright ban on fracking.

Please deny ALL requests for fracking permits. NO FRACKING IN ILLINOIS!

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Darcy Leach

And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Dan Delorenzo

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

020972

rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal. Fracking anywhere near the New Madrid Fault should be out of the question.

Since massive amounts of water are needed, how are you protecting sources of drinking water for local residents? Will you protect recreational waterways that so many Illinoisans depend on for their livelihoods?

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Steven Serikaku

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois' essential groundwater resource will be contaminated with cancer-causing 'fracking' chemicals, hydrocarbon gases, and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from 'fracking,' and existing natural fractures and faults all combine to create a network of underground pathways through which toxic chemical and radioactive contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called "'frack' hits," when new fractures from gas and oil 'fracking' intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about "'frack' hits" on current wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). Even then, they only need to consider those current wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously very inadequate! Just this past September, in New Mexico, 'fracking' at one well blew fluids out of a neighboring wellhead located a half mile away. (That was 2,640 feet away!)

Section 245.210(a)(6)(A) also reveals how vague the criteria for 'fracking' permits are. Actually, very little is known about the connectivity of toxic chemical and radioactive contamination pathways below ground. However, we do know is that widespread 'fracking' will expand these pathways, creating new routes for hazardous contamination which we might not see for decades.

As for the massive volumes of toxic waste generated by 'fracking,' there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be AVOIDED WITH AN OUTRIGHT BAN ON ALL OIL AND GAS 'FRACKING!' [I am one of the original, modern environmental/energy activists dating back to around the very first "EARTH DAY" (Wednesday, April 22, 1970), over 43 years ago. I have a Bachelor of Science (B.S.) Degree in Biology and Environmental Studies from Dana College, Blair, Nebraska. I strongly support a non-fossil-fuel (non-gas and oil 'fracking')/non-nuclear energy pathway, which is based upon these things: Greatly increased energy efficiency, sustainable liquid biofuels (enzymatic biodiesel and cellulosic ethanol) produced from regional feedstocks, municipal and farm methane biogas co-digesters, solid biomass-fueled combined heat-and-power (CHP)/district heating systems, community-operated solar photovoltaic (PV) projects with "feed-in tariffs," community-owned wind turbines using "group net-metering," solar agricultural process heat for drying grains, higher-temperature solar industrial process heat, solar domestic and commercial water heating, passive solar space heating and cooling, lower-temperature

fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

Sincerely,  
Richard Bathje

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Amy Hedstrom

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing

021037

respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

021050

(measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Joseph Sessa

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

021051

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well

021052

There are several other problems that the proposed regulations hardly begin to address. However, these problems would best be avoided with an outright ban on fracking in Illinois. But under the current rules, Illinois could easily be turned into a wasteland unfit for living or farming.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Don Dieckmann

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
John Williams

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock

021077

of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Charles Petrof

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

021078

well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Sherri Webber

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Cristen Leifheit

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

How are we ignoring all of the known hazards brought with Fracking? The regulations are not strict enough and it is going to cost our health and the health of our families and severe damage to our environment.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

021092

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

021105

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Patmarie Bailey-Swartz

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

I gave 25 years of my life in service to this country so our people could live a happier existence. But people can't live without clean water, and you can't drink oil!!! Don't screw up our natural resources. !!! Don't be a bought dog!!! Once its gone, its gone! We will end up trucking in water like other communities who have had fracking on their land. Destruction of the water will sit on your soul, and the diseases of mankind will be on your hands. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Alex Booker

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. 021138

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

Most importantly, these new rules will almost guarantee that Illinois's groundwater will be contaminated with cancer-causing chemicals, gases and even radioactive brines.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is grossly inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet.

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Little is known about the connectivity of contamination pathways below ground. However, we do know that widespread drilling and fracking itself combined with leaking and failing casings will expand these pathways. These plus existing natural geological features may create new routes for contamination that may not be manifest for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are other problems that the proposed regulations only begin to address. However, all problems associated with fracking would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Cynthia Wright

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of

021144

hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
EMI DAY

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

021171

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Thomas Frazzetta

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to

021183

away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
J. Fiola

021196

rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

021210

outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Laura Strong

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Darlene Pavlik

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

021223

wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for

021263

fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Ronald Golland

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Dawn Albanese

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Food & Water Watch

Subject: Not One Fracking Permit-only when the safety of drinking water and lives can be guaranteed

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines. I listened to the forum online, that you had for these rules last week and I was appalled that these rules are so inadequate on keeping our groundwater and drinking water safe and human lives.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois

021287

will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems such as not providing the health professionals with a complete list of all chemicals that will be used in this process, that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Loryn Ankeny

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits

021289

on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking. NO FRACKING! Please let us invest in solar or even wind power instead. We can do it.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Bonita Staas

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to

021290

create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for

021303

fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Pyre Hubbard

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Marianne Schenker

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, what we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

021329

well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
David Domal

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned

021330

wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

021343

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Tymue Upshire

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing

021356

fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Rona omer

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed

021369

rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Although I do not live anywhere near the site, I am very concerned about the water supply in this state and country. Anything, increased energy or not, is more important than having clean air to breathe and water to drink.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Susan Spengler

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously

021379

inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Food & Water Watch

Subject: Please Not One Fracking Permit

021382

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

Please please no fracking. It's so wrong on so many levels, literally.  
I'll support you 100% against any business pressure to issue permits.  
Please please

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Christopher Bakker

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for

021397

fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jo Beth Harrison

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Justin Hoffman

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed

021433

well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Kerry Kuhn

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources

021434

and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Pamela Kersting

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or

021453

abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Food & Water Watch

Subject: Not One Fracking Permit

021470

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence

021471

of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Debra Diana

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Karen Wilson

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

021489

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock

021507

formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
K Brinkmann

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

021525

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile

021526

away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
LaToya Belt

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating

021545

new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking. That is what I demand. You are charged with protecting our natural resources. You are not charged with allowing our environment to be despoiled. We, the People owe no allegiance to the extraction industries.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
David Atwood

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under

021562

the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Judy Davy

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

It's your duty to protect the citizens of Illinois. Clean, uncontaminated water is essential to life. Everyone depends on it. Special interests should have no bearing on your responsibility to assure us that our water will not be jeopardized.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well

021581

(measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Marc Maschino

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to

021617

create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Robert Handelsman

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for

021619

fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

Look at all the trouble other states, such as Pennsylvania, have had from fracking. Look at our drought a couple summers ago. There is no way to protect our environment from all the dangers of fracking. The only answer is to ban it altogether. Can you guarantee NO damage to our environment if fracking is allowed?

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Marilea White

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and

021635

fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Frank Raguso

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from

021636

fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules dare a disgrace to those who approved them, and a t raggedy for the state of Illinois. They must have been written in profound ignorance of the facts, or with a profound disregard for anyone except industry lobbyists. They will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines. By the way, the NRDC magazine On Earth shows categorically that the amount of oil/gas saved through energy efficiency outweighs the amount extracted by a greedy and irresponsible, to-hell-wiith-the-future industry.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits,

021652

when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and

021654

fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jeff Schneider

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Ron Gary

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating

021673

new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Tim Hoyt
