

fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Dan Malooly

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

This is why the public doesn't trust our government to make the hard decisions needed to protect our environment. Why in the world would The Illinois Department of Natural Resources, the very department SWORN to protect our resources and keep our groundwater safe and untainted, release new INADEQUATE regulations for fracking in our state?? Fracking has already PROVEN to pollute and poison the lands and environments surrounding these "extraction" sites. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

The Illinois Department of Natural Resources CANNOT allow this to happen! The people of Illinois are depending on you to protect us. Don't be coerced by promises of "jobs and money". Believe me, Illinois will see little profit despite the enticing promises and perks being dangled in front of your department. There are things that are far more important than the wealth of these corporations whose only goal is to make more and more profit and the future be damned. Once these waters are contaminated, they are poisoned forever. It can't be undone!!

New oil and gas wells with cement or casing failures, aging or

026000

abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Linda Sullivan

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for

626019

fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

020035

(a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Leland Becker

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those

026065

existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
David Rechs

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
James Sarelas

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

020074

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Food & Water Watch

Subject: Do what is right for the earth . Do not let GREED prevail.

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

What are we getting in return for destroying our most precious resources that are vital for not only the next generation of humans but the total ecosystem ?? Do you really believe that we must continue the earths destruction in the name of job creation ? ? It is clear there is value, big value to the few with the mega bucks and mega influence on the DNR to compromise the life quality of the masses . There will be no turning back once the damage is done and the legacy of the DNR will be one of shame. Countless jobs could be created with the development of safe alternate energy sources. ASs it stands , those running away with shameful money will not be around to see their systems fail. Greed has made all of them terribly short sighted. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

020091

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Tim Marcum

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well

026119

(measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Sandra Virella

Subject: Not One Fracking Permit--Please support a ban on fracking!

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

Dear DNR,

The most valuable resources that we have in Illinois are our abundant water and our rich farmland. Both of these would be destroyed by fracking.

626113

When that happens, and it will, Illinois will be a state of ghost towns.

No amount of fracking industry propaganda is going to convince people that it is safe, because there are so many examples that already exist that prove that it is NOT SAFE.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Just this past September, in New Mexico, fracking at one

020123

well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Daniel Becker

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources

026129

and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating

new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
David Gustafson

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Leah Orgel

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well

020166

(measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an

outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Katharine Egan

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and

020202

fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on tracking.

I don't want to see any form of fracking in this state, what's more important fuel that kills our water and land or lives? I rather ride a horse than to sacrifice my grand children's future health. Do what the people who elected you to do want not what special interest want. No means NO!!!!

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jose Santiago

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing

020203

fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it

626221

back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Judith Hultzen

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jeremy Kirkman

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules.

626239

The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an

outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

020237

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Matt Fitzgerald

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from

020270

fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

I support a total ban on fracking for Illinois!

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Eileen Welch

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

020284

widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and

626292

fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

The people of Illinois will not sit idly by; Private hydraulic fracturing companies, the government, and all others with vested interests in fracking cannot possibly hope to simply force their way of doing things through on this issue. There will be governmental oversight with strict rules, or no fracking at all. Although the latter is what I prefer, we will in no instance give up on getting our home and our people the best possible treatment and opportunities as are humanly possible.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
William Kavanagh

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under

620310

the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Myra Perez

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an

626324

outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Michael Ramirez

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Jamie Nichols

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater,

626337

our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

026059

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Susan Mitchell

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Dear Illinois Department of Natural Resources Food & Water Watch,

626363

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
John Schwab

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those

existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Christian Gray

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned

626483

wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Mark Haeseler

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

I CAN ONLY BELIEVE THAT YOU HAVE BEEN PAID TRAITOR MONIES TO BELIEVE THAT SUCH RULES ARE GOOD FOR US. WHERE DO YOU LIVE? WHAT WATER DO YOU DRINK? SHAME ON YOU ALL FOR EVEN THINKING OF ALLOWING THE GAS & OIL COMPANIES TO DESTROY OUR HABITAT...

These new rules will virtually guarantee that Illinois's groundwater,

026404

our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

626416

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating

626417

new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater,

026429

our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines. It has happened in other areas.

Companies engaged in fracking elsewhere have shown they are not concerned with the public interest. Their main interest is providing increased profits and any increase in jobs is secondary. These companies wish to keep secret the chemicals used in the process because they are dangerous and contaminants. The argument that the chemicals are proprietary is unacceptable.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Peter Schultz

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well

020443

(measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Tony Gray

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Vincent Marneffe

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

626457

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Heather Ruhnke

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Emily Jones

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or

020470

hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

020483

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Patricia Oleson

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Siv Ferguson

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from

626436

hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Tom Shepherd

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

We live in a world where we can control many health variables. Pollution and Climate Change are two we seem to have the least amount of ability to counteract. The only levers we possess is to decrease pollution, minimize gas output and control chemical waste. I urge you to utilize the few levers we have to foster a healthy living planet and minimize fracking and its dangerous side effects.

The new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines. These types of effects are counterproductive to a healthy living environment.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

626508

widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock

626509

formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Donna Hayes

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and

626810

grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and

626523

well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Mary Neubecker

Subject: Reasonable regulations

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

Please ignore the above paragraph... I didn't write it, but cannot get rid of it.

This is the text of my letter:

I support fracking as long as there are regulations in place that make certain that casings are installed properly and do not leak. Furthermore, I believe that there should also be regulations that prohibit the storage of wastewater in unlined ponds.

Please don't be swayed by the well-intentioned, but misguided environmentalists or by the anti-corporatists masquerading as environmentalists.

Please ignore the paragraph below... I didn't write it, but I cannot get rid of it.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of

626536

contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Nancy L Cowger

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking":

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Dan Madden

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

Your new "rules" concerning the dangerous and unnecessary gas-retrieval method called fracking, might as well have been written by the rapacious gas and oil industries. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Stephen Gliva

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can

020563

flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence

026376

of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
A.G. Hansen

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These rules promote rather than regulate fracking. Your Dept. is supposed to see that the air and water --and the air and water as well as other natural assests--are here in good order for the future. With all the development of alternative energy as well as the conservation practices being put in place we do not need to allow any fracking to take place. None of us know the underground systems that may be .disturbed when we do not need the oil from them. Some companies want to make money by fracking but we cannot let them just because they can make a buck--they think but that oil will be costly.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Putting it back in the earth is hardly an adequate answer. Regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such underground disposal.

DO) NOT ALLOW FRACKING IN ILLINOIS---LET US BE AHEAD IN THIS RATHER THAN AT THE BACK OF THE LINE OF STATES AS WE ARE IN SEVERAL OTHER AREAS.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one

020589

well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Stephen Komistra

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

020603

Sincerely,  
NELSON FLUKER

However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Rick David

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

Subject: NO to FRACKING

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

Hydraulic Fracturing has a dismal track record. Once a pocket of ground water is affected, it becomes permanently contaminated by toxic chemicals and the surrounding area becomes unfit for human habitation. On behalf of my fellow citizens, I urge your department to block this destructive practice in our state.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Raymond J Strauss

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

020029

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Patricia Collins

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

In a few words, I want to say that I am totally opposed to fracking. We have so many chemicals in our air and water now that are hazardous

020630

to our health that we don't need anymore. Fracking has a very poor track record, we don't need it in Illinois.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Merle Felder

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

020043

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking":

I think that you could equate fracking (even the word is offensive.) to sticking a needle in your mother's arm and somehow drag it along through tissue, muscle, ligaments, etc...trying to find healthy blood deposits. It is the same. And just because you can't hear the screaming, doesn't mean that the earth is not screaming to save her life.

You all no this is an apt description. And I know that deep down within yourselves you are morbidly ashamed. End the practice completely.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

I do realize that Illinois needs energy and jobs. But do we not need clear water for the future? Do we not need an atmosphere with less carbon and methane?

Why would not Illinois invest in renewable energy, thus giving us energy and jobs minus the pollution, noise, and use of resources required by fracking? The new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

Do you have children and grandchildren? If not, others do. Please think several generations forward, and do not be misled by immediate profits. They won't be able to buy healthy water, soil, and air when the

1320049

generations need them.

Multiple examples prove that fracking is not safe. Anyone who thinks it is has not read the research, but been fooled by corporate propaganda.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

The rules are inadequate at best. If nothing else, please delay action on drilling wells until you have more information about the dangers.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Therese MacKenzie

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Lana Night

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Thomas Goodrich

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking":

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile

026632

away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Kim Rice

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under

020683

the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Janet Neal

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from

026709

fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
William Kroll

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that

020723

widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits

020736

on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Patricia King

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and

well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Robert Urnikis

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

I cannot believe that we are going to go ahead and let the frackers do whatever they want in Illinois. Why is it okay to poison Illinois like this, dear IDNR? Please just ban fracking in this state!

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

We often look to science to extend the comforts and conveniences of life in our world, including looking for ways to get more energy. However, history shows us that there are often unintended consequences for new technologies. We cannot afford to assume that because some scientists say a new source of energy is safe enough, that we should believe them. We are the ones who will be paying for any future unintended consequences. Caution must be used. We only have one world to live on - we must be the best stewards of it we can possibly be.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Timothy Neuenkirchen

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

020763

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of

020776

contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Alicia Zody

Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Anne Marie Leofanti

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking";

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

And even then, they only need to consider those

626802

existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground. However, we do know is that widespread drilling and fracking will expand these pathways, creating new routes for contamination that we may not see for decades.

As for the massive volumes of toxic waste generated by drilling and fracking, there are no good options for disposing of it. Injecting it back underground is the industry's favored option, as the proposed rules anticipate, but regardless of the rules, the risk that Illinois will be struck by damaging earthquakes will increase as a consequence of such disposal.

There are several other problems that the proposed regulations only begin to address. However, these problems would best be avoided with an outright ban on fracking.

In closing, I urge you to protect Illinois residents by refusing to issue a single permit for high-volume hydraulic fracturing until these regulations and the fracking industry can guarantee the health, safety and well being of the communities that surround any high-volume hydraulic fracturing operation.

Sincerely,  
Frank Mores

Food & Water Watch

Subject: Not One Fracking Permit

Dear Illinois Department of Natural Resources Food & Water Watch,

I am writing to you regarding the proposed Hydraulic Fracturing Act administrative rules. The proposed rules are grossly inadequate and would fail to protect our natural resources and our communities from hydraulic fracturing, better known as "fracking."

Until you can prove no ill effect to our water and our air do not permit any new company created process like fracking.

These new rules will virtually guarantee that Illinois's groundwater, our most essential resource, will be contaminated with cancer-causing fracking chemicals, hydrocarbon gases and even radioactive brines.

New oil and gas wells with cement or casing failures, aging or abandoned wells with their own leaky casings, new fractures from fracking, and existing natural fractures and faults all combine to create a network of underground pathways through which contaminants can

026803

flow.

Specifically, in the proposed rules, Sections 245.210 (at (a)(6) and at (a)(7)), 245.815 (at (b)) and 245.1010 introduce an arbitrary and grossly inadequate measure to protect against so called frack hits, when new fractures from fracking intersect with aging and abandoned wells. According to these sections, to be permitted in Illinois under the proposed rules, operators would only have to worry about frack hits on existing wells that are within 750 feet of the proposed well (measured as the minimum distance between any two points along two respective boreholes). And even then, they only need to consider those existing wells if they were drilled to within 400 feet of the rock formation that the new well would target. This regulation is obviously inadequate. Just this past September, in New Mexico, fracking at one well blew fluids out of a neighboring wellhead located a half mile away. That's 2,640 feet away!

Section 245.210(a)(6)(A) also reveals how vague the criteria for fracking permits are. Very little is known about the connectivity of contamination pathways below ground.
